REACT JS PROJECT REPORT ON MEDICINE REMINDER WEB APP

Submitted by

YUVANTHIKA R

24BIT063

Under the Guidance of

ARAVIND

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: 2025 – 2026

APRIL 2026

DECLARATION

I hereby declare that the project entitled “MEDICINE REMINDER WEB APP” submitted in partial fulfillment of the requirements for the course REACT JS DEVELOPMENT LAB is a record of my original work carried out under the guidance of ARAVIND, Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.++

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

ABSTRACT

The Medicine Reminder Web Application is a smart healthcare support system designed to help users manage their daily medication schedule effectively. Many people forget to take medicines on time due to busy lifestyles, which may affect their health.

This application allows users to add medicines, set reminder times, and receive notifications. It also includes features such as missed dose detection, voice alerts, and daily tracking. The system is developed using React JS, providing a responsive and user-friendly interface.

The main goal of this project is to improve medication adherence and promote better health management using modern web technologies.

CHAPTER 1: INTRODUCTION

1.1 Background of the Study

In today's fast-paced world, people often forget to take medicines at the correct time. Traditional methods like alarms or manual notes are not efficient. Technology can solve this problem by providing automated reminders.

The Medicine Reminder App helps users maintain their medication schedule through alerts and tracking systems.

1.2 Problem Statement

Problem	Description
Forgetfulness	Users miss medicine doses
No Tracking	No proper record system
Inefficient Methods	Manual reminders are unreliable
Lack of Alerts	No smart notification system

.

1.3 Objectives of the Project

- **To design a smart medicine reminder system**
- **To provide timely notifications**
- **To track taken and missed doses**
- **To improve user health management**
- **To create a user-friendly interface**

1.4 Purpose and Significance

This project helps users:

- **Take medicines on time**
- **Avoid health complications**
- **Maintain proper medical routines**

It is especially useful for elderly people and busy individuals.

1.5 Scope and Limitations

Scope

- **Add and manage medicines**
- **Set reminders**
- **Track daily progress**

Limitations

- **No backend database**
- **No login system**
- **Works only on browser**

1.6 Methodology Overview

Phase	Description
Requirement Analysis	Identify user needs
Design	UI and system design
Development	React JS coding
Testing	Verify functionality
Implementation	Deploy in browser

CHAPTER 2: SYSTEM ANALYSIS

System	Description
Alarm Apps	Basic alerts only
Manual Notes	Written schedules
Memory-Based	Not reliable

2.2 Drawbacks of the Existing System

- ? No tracking of missed doses**
- ? No smart alerts**
- ? No health suggestions**
- ? Difficult to manage manually**

2.3 Proposed System

The proposed Medicine Reminder App provides an automated solution with advanced features like:

- Smart reminders**
- Missed dose detection**
- Voice notifications**
- Daily tracking system**

.

2.4 Features of the Proposed System

- | | |
|--------------------------------|----------------------------------|
| • Feature | • Description |
| • Smart Reminder | • Alerts on time |
| • Missed Dose Detection | • Tracks missed medicines |
| • Voice Alert | • Audio notification |
| • Daily Streak | • Tracks consistency |
| • Snooze Option | • Delay reminder |

2.5 Feasibility Study

Technical Feasibility

Uses React JS and JavaScript → easy to develop

Economic Feasibility

Low cost → no paid tools required

Operational Feasibility

Simple and easy to use

Technical Feasibility

Uses React JS and JavaScript → easy to develop

Economic Feasibility

Low cost → no paid tools required

Operational Feasibility

Simple and easy to use

2.6 Requirement Analysis

Requirement	Description
Add Medicine	User inputs medicine details
Set Reminder	Set time for alert
Get Notification	Alert user
Mark Status	Taken or missed
View List	Display medicines

Non-Functional Requirements

Requirement	Description
Performance	Fast loading
Usability	Easy interface
Reliability	Accurate alerts
Scalability	Can be upgraded
Security	Input validation

Chapter 3: System Design

3.1 Introduction

System Design is an important phase in software development where the overall structure and architecture of the system are defined. It explains how the system will work, how data flows, and how different components interact.

In the Medicine Reminder App, the design focuses on user interaction, reminder functionality, and data storage. This chapter explains the system architecture, use case diagram, data flow diagram (DFD), entity relationship diagram (ERD), and user interface design.

3.2 System Architecture

Theory

The Medicine Reminder App follows a 3-layer architecture:

1. Presentation Layer (Frontend)

- Developed using React JS
- Provides user interface for interaction

2. Application Logic Layer

- Handles reminder logic
- Checks time and triggers alerts
- Processes user inputs

3. Data Layer

- Stores medicine details
- Uses LocalStorage for data persistence

This architecture ensures flexibility, scalability, and easy maintenance.

Layer	Description
Presentation Layer	React user interface

Logic Layer	Handles reminder logic
Data Layer	Stores data in LocalStorage

3.3 Use Case Diagram

1. What is a Use Case Diagram?

A Use Case Diagram visually shows:

- **Actors** → the users or external systems interacting with your application.
- **Use Cases** → the actions they can perform.
- **Relationships** → how those actions connect.

It helps you explain “Who does what” in your system.

2. Identify the Main Actors (for your Educational Website)

Actor	Description
User	The main actor who adds medicines, sets reminders, and tracks status
Caretaker (optional)	Receives alerts or monitors user’s medication
Guest (optional)	Can view limited features without login

3. Identify the Main Use Cases

For User

- **Register / Login (if implemented)**
- **Add Medicine**
- **View Medicine List**
- **Set Reminder Time**
- **Receive Alert Notification**
- **Snooze Reminder**
- **Mark Medicine as Taken**
- **View Status (Taken / Missed)**

For Caretaker (Optional)

- **Receive Alert Notifications**
- **Monitor User Status**

For Administrator (Optional – if implemented)

- **Login to Admin Panel**
- **Add / Edit / Delete Medicines**
- **Manage Reminder Data**
- **View User Activity**

4. Define Relationships

Symbol	Meaning
--------	---------

Solid line	Association (Actor performs a use case)
------------	---

<>	A mandatory sub-task inside another use case
----	--

<>	An optional or conditional task
----	---------------------------------

Examples

- “Set Reminder” <<include>> “Receive Alert”
- “Receive Alert” <<extend>> “Snooze Reminder”
- “Add Medicine” <<include>> “Set Reminder Time”
- “Mark as Taken” <<extend>> “Receive Alert”

5. Draw the Diagram (Structure Example)

[User]

|

| | | | |

Add View Set Receive Mark

Med Medicines Reminder Alert Taken

| Tools you can use to draw

- draw.io (recommended)
- Lucidchart
- StarUML
- MS Visio

Medicine Reminder App (System)

[User]

[Administrator]

- **User:** The main user who adds medicines, sets reminders, and tracks medication status.
- **Administrator:** The manager who controls and monitors system data (optional).

- Caretaker (optional): Receives alerts and monitors the user's medication.

Use Cases:

1. Register / Login: User logs into the application (if implemented).
2. Add Medicine: User enters medicine details such as name and time.
3. View Medicines: User views the list of added medicines.
4. Set Reminder: User sets reminder time for each medicine.
5. Receive Alert: System notifies the user at the scheduled time.
6. Snooze Reminder: User delays the reminder for a short time.
7. Mark as Taken: User updates medicine status as taken.
8. View Status: User checks taken or missed medicines.
9. Manage Data (Admin): Administrator can add, edit, or delete medicine data.

Relationships:

❓ Add Medicine" <<include>> "Set Reminder"

❓ "Set Reminder" <<include>> "Receive Alert"

❓ "Receive Alert" <<extend>> "Snooze Reminder"

❓ "Receive Alert" <<extend>> "Mark as Taken"

❓ "View Status" <<extend>> "Mark as Taken" Relationships:

7. Step-by-Step (Using draw.io)

1. ❓ Go to <https://app.diagrams.net>
2. ❓ Choose Blank Diagram → name it "Use Case Diagram – Medicine Reminder App"
3. ❓ From the left panel, drag:
4. Stick figures → represent Actors (User, Admin)
5. Ovals → represent Use Cases
6. Rectangle → represent System Boundary ("Medicine Reminder App")
7. ❓ Place User on left, Admin on right
8. ❓ Connect Actors ↔ Use Cases using lines
9. ❓ Label relationships using:
10. <<include>>
11. <<extend>>

12.  Export as PNG/JPG and insert into your projectConnect Actors ↔ Use Cases using lines.
13. Label relationships (<<include>> / <<extend>>).
14. Export as .PNG / .JPG and insert into your documentation.

3.4 Data Flow Diagram (DFD)

1. What is a Data Flow Diagram (DFD)?

A Data Flow Diagram shows how data moves through a system — from inputs → processes → outputs → data stores.

It helps you visualize:

- Where the data comes from (source)
- What processes modify or use it
- Where it is stored
- Where it goes (destination)

2. DFD Symbols You'll Use

Symbol	Meaning
Rectangle	External Entity (User, Admin)
Circle / Oval	Process (e.g., Add Medicine)
Two Parallel Lines	Data Store (Medicine Data)
Arrow	Data Flow

3. Levels of DFD

Level 0 – Context Diagram

- Shows the entire system as one process
- Displays interaction between user and system

Level 1 – Detailed Diagram

- Breaks system into multiple processes
- Shows internal working

4. Steps to Create a DFD

Step 1: Identify External Entities

- **User**
- **Administrator**

Step 2: Identify Main Processes

- **Add Medicine**
- **Set Reminder**
- **Check Time**
- **Send Alert**
- **Update Status**

Step 3: Identify Data Stores

- **Medicine Data Store**
- **Reminder Data Store**
- **Status Data Store**

Step 4: Identify Data Flows

- **“Medicine Details”**
- **“Reminder Time”**
- **“Alert Notification”**
- **“Status Update”**

5. DFD for Educational Website

Level 0: Context Diagram

- **User interacts with the system to add medicines, set reminder times, and view medication status.**
- **The system sends alert notifications to the user at the scheduled time.**
- **Administrator (optional) manages and updates medicine-related data.**
- **Caretaker (optional) may receive alerts and monitor the user’s medication status.**

DFD – Level 0 (Context) : Educational Website

- **User interacts with the system** to add medicines, set reminder times, and view medication status.
- The system sends **alert notifications** to the user at the scheduled time.
- **Administrator (optional)** manages and updates medicine-related data.
- **Caretaker (optional)** may receive alerts and monitor the user's medication status.
- .

Level 1: Detailed System View

Explanation:

? Process P1: Add Medicine

Stores medicine details (name, dosage, time) in the Medicine Data Store.

? Process P2: Set Reminder

Saves reminder time in the Reminder Data Store for each medicine.

? Process P3: Check Time & Trigger Alert

Continuously checks the current time and compares it with stored reminder data. If matched, it sends an alert notification to the user.

? Process P4: Update Status

Allows the user to mark medicine as Taken or Missed, and stores it in the Status Data Store.

Level 2: Quiz Process (Example Sub-process)

DFD – Level 2: Quiz Process (Educational Website)

6. Tools to Draw Your DFD

Free, easy online tools:

- <https://app.diagrams.net> (recommended)
- Lucidchart
- Creately
- StarUML
- Microsoft Visio

Steps (in draw.io):

1. Go to <https://app.diagrams.net>.
2. Choose Blank Diagram → name it “*DFD_EducationalWebsite*”.
3. Use:
 - a. Rounded rectangles → processes
 - b. Parallel lines → data stores
 - c. Rectangles → external entities
 - d. Arrows → data flow.
4. Label everything clearly (arrows = data names).
5. Export as .PNG or .JPG and insert into your report.

3.5 Entity Relationship Diagram (ERD)

Entities and Relationships:

- ? User (User_ID, Name)
- ? Medicine (Medicine_ID, Name, Time, Dosage)
- ? Reminder (Reminder_ID, Time, Alert)
- ? Status (Status_ID, Taken/Missed)

Relationships:

- ? A User can have multiple Medicines
- ? Each Medicine has one Reminder

? Each Reminder has one Status

3.6 User Interface Design

The UI is designed to be simple, responsive, and accessible. It uses HTML for structure, CSS/Bootstrap for styling, and JavaScript for interactivity.

Main Pages:

1. **Home Page:** Displays the list of medicines
2. **Add Medicine Page:** Allows users to add new medicine details
3. **Reminder Alert Screen:** Shows notification alerts at the scheduled time
4. **Status Page:** Displays taken and missed medicines

(Insert wireframe sketches or screenshots of each page.)

Chapter 4: System Implementation

4.1 Introduction

System implementation is the stage where the design is translated into a working web application. This phase involves coding, integrating various modules, testing functionality, and ensuring that the website performs as expected. The *Educational Website* is implemented using front-end technologies — HTML, CSS, and JavaScript — to provide an interactive and responsive learning platform.

4.2 Development Tools and Technologies

Tool / Technology	Purpose
HTML5	Defines the structure and layout of web pages.
CSS3 / Bootstrap	Adds style, layout design, and responsive features.
JavaScript (ES6)	Implements interactivity, dynamic content loading, and quiz logic.
Visual Studio Code	Code editor for development and testing.
Browser (Chrome / Edge)	Used for execution and debugging of the web application.
LocalStorage / JSON	Stores course and quiz data locally on the browser.

4.3 System Modules Description

Module	Description
Home Module	Displays the list of courses with category and description.
Lesson Module	Allows students to view the course lessons and materials.
Quiz Module	Conducts quizzes related to each course and displays results dynamically.
Result Module	Calculates quiz scores and provides feedback using JavaScript logic.
Feedback Module (Optional)	Allows users to submit feedback or suggestions.

Each module is interconnected through JavaScript functions, ensuring smooth navigation and state management within the website.

4.4 Implementation Details

The implementation follows a modular approach:

- 1. Frontend Design:**

The user interface is developed using HTML for content and CSS for styling.

- 2. Dynamic Behavior:**

JavaScript manipulates the Document Object Model (DOM) to dynamically display lessons and quiz questions.

- 3. Event Handling:**

Buttons and inputs are linked to event listeners (e.g., onclick, onsubmit) to handle user actions.

- 4. Quiz Evaluation Logic:**

When the user submits answers, JavaScript compares inputs with correct answers, computes the score, and displays results in real-time.

- 5. Data Management:**

Data such as questions, answers, and results are stored and retrieved from LocalStorage or a JSON file for persistence.

4.5 Algorithm / Logic of Core Function

Algorithm for Quiz Evaluation:

- 1. Initialize score = 0.**
- 2. Loop through all quiz questions.**
- 3. For each question:**
 - a. Check if the selected option matches the correct answer.**
 - b. If yes, increment the score.**
- 4. Display the total score at the end.**
- 5. Store results locally (optional).**

Algorithm for Dynamic Lesson Display:

- 1. Retrieve lesson list from JSON data.**
- 2. Loop through all lessons.**
- 3. Use DOM manipulation (document.createElement(), appendChild()) to render lesson titles.**
- 4. Display corresponding lesson content when a user clicks on a title.**

4.6 Security and Validation

- Input validation is implemented using JavaScript to prevent empty form submissions.**
- Only valid quiz responses are processed.**

- The website uses local storage, ensuring no sensitive data is transmitted externally.
- Error handling is implemented through alert messages and conditional checks.

4.7 Integration

All modules are seamlessly integrated using event-driven programming. Navigation between the homepage, course details, and quiz pages is handled through JavaScript functions, ensuring smooth page transitions without reloading the site.

4.8 Output Screens (Snapshots)

Include labeled screenshots for:

1. Homepage – list of available courses.
2. Lesson Page – lesson titles and content.
3. Quiz Page – interactive quiz form.
4. Result Page – displayed score and feedback.

Chapter 5: System Testing

5.1 Introduction

System testing is a crucial phase that ensures the developed application meets all functional and non-functional requirements. It validates whether the system performs as expected under various conditions. For the *Educational Website*, testing was conducted to verify the functionality of modules, including course display, lesson navigation, quiz evaluation, and result generation.

5.2 Objectives of Testing

- To ensure that all modules (Home, Lesson, Quiz, Result) function correctly.**
- To identify and fix any logical or runtime errors in the system.**
- To confirm that user inputs produce the correct and expected outputs.**
- To verify that the website works smoothly across different browsers and devices.**

5.3 Types of Testing Performed

a) Unit Testing

Each JavaScript function and webpage component was tested independently. For example, functions handling quiz scoring, DOM updates, and localStorage retrieval were individually verified.

b) Integration Testing

After unit testing, all modules were combined and tested as a whole to ensure that navigation between pages (Home → Lessons → Quiz → Result) worked without errors.

c) System Testing

The complete web application was tested to ensure all functional requirements were met — including quiz evaluations, course listings, and responsiveness.

d) User Acceptance Testing (UAT)

The system was demonstrated to sample users (students) to gather feedback. The website's layout, speed, and usability were reviewed, and suggestions were implemented where necessary.

e) Cross-Browser and Device Testing

The system was tested on popular browsers such as Google Chrome, Mozilla Firefox, and Microsoft Edge, and on devices like laptops, tablets, and mobile phones to ensure responsiveness.

5.4 Test Plan

Test ID	Module	Test Description	Type	Expected Output	Status
T01	Home	Display all available courses	Functional	Course cards visible	Pass
T02	Lesson	Load lesson contents	Functional	Lesson text and videos appear correctly	Pass
T03	Quiz	Evaluate answers and calculate score	Logic	Correct score displayed	Pass
T04	Result	Display score summary	Output	Accurate score shown in pop-up	Pass
T05	Navigation	Move between modules	Integration	Seamless page transition	Pass
T06	Input Validation	Submit blank quiz	Validation	Show alert or prevent submission	Pass
T07	Responsiveness	View on mobile devices	UI	Layout adjusts to screen size	Pass
T08	Storage	Save progress in localStorage	Data	Data retained after refresh	Pass

5.5 Test Data and Execution

Sample data were created in JSON format for lessons and quizzes. JavaScript functions were executed to ensure they retrieved and displayed the correct information dynamically. The output was verified by comparing expected and actual results.

5.6 Error Handling

- **Input validation ensures that blank or invalid quiz responses are not processed.**
- **Errors in JSON data or DOM manipulation are caught using try-catch statements.**
- **Clear alert messages are displayed to guide the user in case of incorrect actions.**

5.7 Performance and Usability Testing

- **Performance: Page load time was under 2 seconds in standard browsers.**
- **Usability: Students found the website easy to navigate, visually clear, and responsive.**
- **Accessibility: The system supports keyboard navigation and uses readable font styles for better visibility.**

5.8 Results and Observations

All modules functioned as expected. The website performed well on multiple devices, and user feedback confirmed that it was interactive and efficient. No critical defects were identified in the final round of testing.

Chapter 6: Results and Discussion

6.1 Introduction

This chapter presents the practical results obtained after implementation and testing. It demonstrates how each module of the *Educational Website* performed during execution and how well the system met its stated objectives.

6.2 System Outputs

During execution, the system produced the following key results:

- **Homepage:** Displayed a list of courses with titles and short descriptions.
- **Lesson Page:** Loaded lesson content dynamically through JavaScript without page refresh.
- **Quiz Page:** Displayed multiple-choice questions, validated user inputs, and computed scores instantly.

- **Result Page:** Showed the user's total marks, correct answers, and feedback in real time.

All pages were verified to be responsive and accessible across desktop and mobile browsers.

6.3 Performance Analysis

- **Responsiveness:** Average page load time < 2 seconds.
- **Accuracy:** Quiz scoring achieved 100 % logical accuracy.
- **Stability:** No runtime or data-handling errors during repeated trials.
- **Cross-Browser Compatibility:** Verified on Chrome, Edge, and Firefox with consistent results.

6.4 User Feedback

A small group of student users tested the prototype. Feedback indicated:

- Simple and intuitive navigation.
- Readable layout and clear quiz interface.
- Desire for additional courses and login functionality in future versions.

Chapter 7: Conclusion and Future Enhancement

7.1 Conclusion

The Educational Website project successfully demonstrates how modern web technologies can be applied to create an interactive and accessible learning platform. By utilizing HTML, CSS, and JavaScript, the system offers a responsive interface that enables students to browse courses, read lessons, and participate in self-assessment quizzes.

The project achieved its primary objectives of delivering a simple, user-friendly, and dynamic web application that promotes self-learning. Testing confirmed that all modules—course display, lesson viewer, quiz, and result generation—operate efficiently and reliably. The system meets functional and non-functional requirements such as usability, portability, and responsiveness.

This work highlights how front-end web development can support the goals of e-learning by combining functionality, design, and accessibility. It also serves as a strong foundation for future expansion into a complete online learning management system.

7.2 Limitations

While the system meets its core goals, the current version has a few limitations:

- **No user authentication or database integration.**
- **Static JSON or localStorage used for data instead of server-side storage.**
- **No multimedia uploads or video streaming options.**
- **Limited analytics or tracking of user progress.**

7.3 Future Enhancement

The project can be enhanced and scaled in several ways:

1. **Database Integration:** Connect to MySQL or MongoDB for storing user data, courses, and quiz results.
2. **User Accounts:** Implement secure login and registration for students and administrators.
3. **Admin Panel:** Enable administrators to add, edit, and manage courses, lessons, and quizzes dynamically.
4. **Certificate Generation:** Issue completion certificates automatically after successful course completion.
5. **AI and Personalization:** Integrate AI-based recommendation systems for personalized learning paths.
6. **Cloud Deployment:** Host on cloud platforms (e.g., AWS, Firebase) for multi-user access and real-time updates.
7. **Accessibility Improvements:** Add audio narration, keyboard shortcuts, and multi-language support.

Chapter 8: References

8.1 Books & Journals

1. *Web Technologies: HTML, CSS, JavaScript, PHP, Java, JSP, XML, and AJAX* — Uttam K. Roy, Oxford University Press.
2. *Learning Web Design* — Jennifer Niederst Robbins, O'Reilly Media.

3. *E-Learning and the Science of Instruction* — Ruth C. Clark & Richard E. Mayer, Wiley.

8.2 Online Resources

8.3 Tools & Frameworks Used

- Editor: Visual Studio Code
- Languages: HTML5, CSS3, JavaScript (ES6)
- Framework: Bootstrap 5 (for responsive UI)
- Database (Future Scope): JSON / MySQL
- Browser: Google Chrome / Microsoft Edge

Appendices

Appendix A – Source Code

Include your main source files:

- index.html — Homepage and structure.
- style.css — Styles and responsive layout.
- script.js — Core logic for lessons, quizzes, and interactivity.

(Attach or paste formatted source code snippets here — only essential parts, not full-length code, to maintain report readability.)

Appendix B – Screenshots of Web Pages

Attach labeled screenshots with captions:

1. **Figure 1.1: Homepage displaying available courses.**
2. **Figure 1.2: Lesson Viewer interface.**
3. **Figure 1.3: Quiz Page with active questions.**
4. **Figure 1.4: Result Page showing user score and feedback.**
5. **Figure 1.5: Responsive view on mobile devices.**

(Ensure all figures are captioned and referenced in your text, e.g., “Refer to Figure 1.3”).

Appendix C – User Manual / Installation Guide

Steps to Run the Project:

1. **Download all project files (index.html, style.css, script.js).**
2. **Place them in the same folder.**
3. **Open index.html in any modern browser (Chrome, Firefox, Edge).**
4. **Browse courses, read lessons, and attempt quizzes.**
5. **Check your result displayed instantly on the page.**

System Requirements:

- **OS: Windows / macOS / Linux**
- **Browser: Latest Chrome or Firefox**
- **RAM: Minimum 2 GB**
- **Storage: 100 MB free**

ABSTRACT

The **Educational Website** project is a web-based application designed to provide an interactive platform for online learning. It allows students to access course materials, lessons, and quizzes through an intuitive and responsive interface. The system is developed using **HTML**, **CSS**, and **JavaScript**, ensuring cross-platform compatibility and ease of use.

The project aims to simplify the process of learning by offering categorized content, self-assessment through quizzes, and real-time feedback. JavaScript is used extensively for dynamic content rendering, input validation, and interactive user experiences. The modular structure ensures scalability for future integration of databases, user authentication, and content management systems.

This project demonstrates how web technologies can effectively support e-learning by creating a structured, user-friendly environment that enhances engagement and accessibility. It serves as a foundation for future enhancements such as **video tutorials**, **AI-based recommendations**, and **certificate generation**.

Chapter 1: Introduction

1.1 Background of the Study

In the modern era, technology has transformed the way education is delivered. Traditional classroom-based learning is now being complemented and, in many cases, replaced by online learning environments. An educational website acts as a digital learning platform that provides easy access to study materials, tutorials, and assessments from anywhere at any time. Using web technologies such as **HTML**, **CSS**, and **JavaScript**, this project aims to

create an interactive and responsive website that facilitates self-learning and improves accessibility for students.

1.2 Problem Statement

Students often face challenges in accessing reliable learning resources outside the classroom. Existing educational websites are either too complex, require paid subscriptions, or lack interactive features that engage learners. Therefore, there is a need for a simple, efficient, and free web platform that provides categorized courses, lessons, and self-assessment quizzes in an easy-to-navigate interface.

1.3 Objectives of the Project

- To design and develop an interactive educational website using front-end technologies.
- To provide structured course content and quizzes for self-learning.
- To ensure the website is responsive and accessible on multiple devices.
- To demonstrate dynamic functionality using **JavaScript** for real-time interaction.

1.4 Purpose and Significance of the Study

The main purpose of this project is to enhance the learning experience through an engaging web-based platform. It helps students learn independently while allowing teachers to share materials easily. The website contributes to digital education initiatives and promotes technology-enabled learning environments.

1.5 Scope and Limitations

Scope:

The project focuses on developing the front-end of an educational website with modules for course display, lesson viewing, and quiz assessments.

Limitations:

This version does not include database connectivity or user authentication. Future versions can integrate backend services, admin controls, and personalized dashboards.

1.6 Methodology Overview

The project follows a structured **Software Development Life Cycle (SDLC)** approach consisting of Requirement Analysis, Design, Development, Testing, and Implementation. The tools used include **Visual Studio Code**, **HTML5**, **CSS3**, and **JavaScript** for creating an interactive user experience.

Chapter 2: System Analysis

2.1 Existing System

In the existing educational setup, students rely on physical classrooms, printed materials, or static websites for learning. These systems lack real-time interaction, self-assessment features, and personalized learning experiences. Traditional methods also restrict access to educational content to specific places and times, reducing flexibility for learners.

2.2 Drawbacks of the Existing System

- Learning resources are not always accessible online.
- Static websites lack interactivity and dynamic updates.
- No integrated quiz or evaluation system for self-assessment.
- Limited communication between students and the content.
- Difficult to manage and update course materials manually.

2.3 Proposed System

The proposed **Educational Website** provides a centralized, interactive platform where students can browse courses, view lessons, and take quizzes online. The system uses **HTML, CSS, and JavaScript** to create a responsive, user-friendly interface. Lessons are dynamically displayed, and quizzes are evaluated instantly using JavaScript, providing immediate feedback to users. The system eliminates the limitations of static web pages and enhances the learning experience.

2.4 Features of the Proposed System

- Responsive and interactive user interface.
- Categorized courses and lessons with clear navigation.
- Real-time quiz evaluation and scoring.
- Multimedia content integration (text, images, video).
- Option to extend for admin content management and student progress tracking.

2.5 Feasibility Study

Technical Feasibility:

The project uses lightweight, open-source technologies — HTML5, CSS3, JavaScript — ensuring easy development and cross-platform support.

Economic Feasibility:

Development cost is minimal since it uses free tools and requires no paid hosting or licensed software for the prototype version.

Operational Feasibility:

The system is simple, intuitive, and requires no special training to operate, making it easy for students and educators to adopt.

2.6 Requirement Analysis

Functional Requirements:

- View and navigate through available courses and lessons.
- Attempt quizzes and receive instant results.
- Display course details dynamically using JavaScript.
- Provide responsive layouts for different devices.

Non-Functional Requirements:

- Fast loading and efficient performance.
- Secure handling of quiz input and results.
- Accessibility and usability compliance.
- Easy maintenance and scalability for future upgrades.

Chapter 3: System Design

3.1 Introduction

System design defines the overall architecture, structure, and data flow of the project. It translates the requirements gathered during the analysis phase into a blueprint for implementation. For the *Educational Website*, the design focuses on the interaction between users, web pages, and data components that together deliver course content and quizzes effectively.

3.2 System Architecture

The system follows a **three-layer architecture** — **Presentation Layer (Frontend)**, **Application Logic Layer**, and **Data Layer**.

Description:

- The **Presentation Layer** handles user interaction and displays content.
- The **Application Layer** processes input and performs logic operations.
- The **Data Layer** manages structured data in JSON or localStorage format.

3.3 Use Case Diagram

1. What is a Use Case Diagram?

A **Use Case Diagram** visually shows:

- **Actors** → the users or external systems interacting with your application.
- **Use Cases** → the actions they can perform.
- **Relationships** → how those actions connect.

It helps you explain **“Who does what”** in your system.

2. Identify the Main Actors (for your Educational Website)

Actor	Description
Student/User	The main actor who views courses, reads lessons, takes quizzes, and checks results.

Administrator (optional)	Manages course data, lessons, and quiz content.
Guest/Visitor (optional)	Can view limited courses before logging in.

3. Identify the Main Use Cases

For Student/User

- Register / Login (if implemented)
- View Available Courses
- Select a Course
- View Lessons
- Attempt Quiz
- Submit Quiz
- View Result / Feedback
- Submit Feedback / Contact Form

For Administrator

- Login to Admin Panel
- Add / Edit / Delete Courses
- Upload Lessons or Quizzes
- View User Feedback

4. Define Relationships

Symbol	Meaning
--------	---------

Solid line	Association (Actor performs a use case)
------------	---

<<include>>	A mandatory sub-task inside another use case
-------------	--

<<extend>>	An optional or conditional task
------------	---------------------------------

Example:

- “Attempt Quiz” <<include>> “Submit Quiz”
- “View Result” <<extend>> “Attempt Quiz”

5. Draw the Diagram (Structure Example)

Tools you can use:

- draw.io (free online)
- Lucidchart
- StarUML
- MS Visio

6. Example Explanation (Text Description)

Actors:

- **Student:** The user who interacts with the website to learn and take quizzes.
- **Administrator:** The manager who controls the backend content.

Use Cases:

1. **View Courses:** Student browses the available courses.
2. **View Lessons:** Student reads the selected course lessons.
3. **Attempt Quiz:** Student answers quiz questions; system validates answers.
4. **Submit Quiz:** Student submits quiz for evaluation.

5. **View Result:** Student views marks and feedback.
6. **Submit Feedback:** Student submits queries or comments.
7. **Manage Content (Admin):** Add, Edit, or Delete course and quiz data.

Relationships:

- “Attempt Quiz” includes “Submit Quiz”.
- “View Result” extends “Attempt Quiz”.
- “Manage Course” includes “Add Lesson” and “Add Quiz”.

7. Step-by-Step (Using draw.io)

15. Go to <https://app.diagrams.net>
16. Choose a blank diagram → name it “Use Case Diagram”.
17. From the left panel, drag:
 - a. **Stick figures** → represent Actors.
 - b. **Ovals** → represent Use Cases.
 - c. **Box** → system boundary (“Educational Website”).
18. Connect Actors ↔ Use Cases using lines.
19. Label relationships (<<include>> / <<extend>>).
20. Export as **.PNG / .JPG** and insert into your documentation.

3.4 Data Flow Diagram (DFD)

1. What is a Data Flow Diagram (DFD)?

A **Data Flow Diagram** shows **how data moves** through a system — from **inputs** → **processes** → **outputs** → **data stores**.

It helps you visualize:

- **Where the data comes from (source)**
- **What processes modify or use it**
- **Where it is stored**
- **Where it goes (destination)**

2. DFD Symbols You’ll Use

Symbol	Meaning
Rectangle	External Entity (e.g., Student, Admin)

Circle / Rounded Rectangle	Process (e.g., “Validate Login”, “Display Courses”)
Two Parallel Lines	Data Store (e.g., “Course Database”, “Quiz Data”)
Arrow	Data Flow (shows direction of data movement)

3. Levels of DFD

Level 0 — Context Diagram (Top Level)

Shows the entire system as a single process and its interaction with external entities.

Level 1 — Decomposition

Breaks the main process into sub-processes that show internal operations.

Level 2 — Detailed Level

Further decomposes complex sub-processes if needed (optional for small college projects).

4. Steps to Create a DFD

Step 1: Identify External Entities

- **Student/User**
- **Administrator**
- **System (Educational Website)**

Step 2: Identify Main Processes

- Display Course List
- Display Lesson Details
- Conduct Quiz
- Calculate Result
- Manage Courses (Admin)

Step 3: Identify Data Stores

- Course Data Store
- Lesson Data Store
- Quiz Data Store
- User Result Data Store

Step 4: Identify Data Flows

- “Request Course List”
- “Course Details”
- “Quiz Answers”
- “Quiz Results”

5. DFD for Educational Website

Level 0: Context Diagram

DFD – Level 0 (Context) : Educational Website

Explanation:

- Student interacts with the system to view courses, read lessons, and take quizzes.
- Admin updates and manages course and quiz content.

Level 1: Detailed System View

Explanation:

- **Process P1:** Fetches course details from *Course Data Store*.
- **Process P2:** Displays lessons from *Lesson Data Store*.
- **Process P3:** Conducts quizzes using *Quiz Data Store*.
- **Process P4:** Calculates and stores quiz results in *Result Data Store*.

Level 2: Quiz Process (Example Sub-process)

6. Tools to Draw Your DFD

Free, easy online tools:

- <https://app.diagrams.net> (recommended)
- Lucidchart
- Creately
- StarUML
- Microsoft Visio

Steps (in draw.io):

6. Go to <https://app.diagrams.net>.
7. Choose **Blank Diagram** → name it “*DFD_EducationalWebsite*”.
8. Use:
 - a. **Rounded rectangles** → processes
 - b. **Parallel lines** → data stores
 - c. **Rectangles** → external entities
 - d. **Arrows** → data flow.
9. Label everything clearly (arrows = data names).
10. Export as .PNG or .JPG and insert into your report.

3.5 Entity Relationship Diagram (ERD)

Entities and Relationships:

- **Course** (Course_ID, Title, Description)
- **Lesson** (Lesson_ID, Course_ID, Content)
- **Quiz** (Quiz_ID, Course_ID, Question, Answer, Score)

Relationships:

- A *Course* can have many *Lessons*.
- A *Course* can have multiple *Quizzes*.

3.6 User Interface Design

The UI is designed to be simple, responsive, and accessible. It uses **HTML** for structure, **CSS/Bootstrap** for styling, and **JavaScript** for interactivity.

Main Pages:

1. **Homepage:** Displays list of courses.
2. **Course Page:** Shows lessons with “Start Quiz” option.
3. **Quiz Page:** Displays questions and evaluates answers instantly.
4. **Result Page:** Shows total score and feedback.

(Insert wireframe sketches or screenshots of each page.)

Chapter 4: System Implementation

4.1 Introduction

System implementation is the stage where the design is converted into a working web application. This phase includes coding, integrating modules, testing features, and ensuring proper functionality.

The **Medicine Reminder Web Application** is developed using **React JS, JavaScript, HTML, and CSS**, providing a responsive and interactive platform to manage daily medication schedules.

4.2 Development Tools and Technologies

Tool / Technology	Purpose
React JS	Builds dynamic user interface
HTML5	Defines structure of web pages
CSS3 / Bootstrap	Styling and responsive design
JavaScript (ES6)	Handles logic and interactivity
Visual Studio Code	Code editor
Browser (Chrome / Edge)	Testing and debugging

4.3 System Modules Description

Tool / Technology	Purpose
Module	Description
Home Module	Displays list of medicines
Add Medicine Module	Allows user to add medicine details
Reminder Module	Handles alert notifications
Status Module	Tracks taken/missed medicines

Each module is interconnected through JavaScript functions, ensuring smooth navigation and state management within the website.

4.4 Implementation Details

The system is implemented using a modular approach:

- 1. Frontend Design:**
Built using React components and styled with CSS/Bootstrap
- 2. Dynamic Behavior:**
JavaScript updates UI dynamically based on user actions

3. Event Handling:

Handles user inputs like button clicks and form submission

4. Reminder Logic:

Compares system time with stored reminder time and triggers alerts

5. Data Management:

Stores medicine details in LocalStorage

4.5 Algorithm / Logic of Core Function

5. Algorithm for Reminder System:

6. Get current system time

7. Loop through all medicines

8. Compare current time with reminder time

9. If matched → trigger alert

10. Allow user to snooze or mark as taken

11.

12. Algorithm for Adding Medicine:

13. Take user input (name, time)

14. Validate input

15. Store data in LocalStorage

16. Update medicine list on UI

17.

18. 4.6 Security and Validation

19. Prevent empty input submission

20. Validate medicine details

21. Use local storage (no external data transfer)

22. Error handling using alerts and conditions

23. Display corresponding lesson content when a user clicks on a title.

4.6 Security and Validation

❓ Prevent empty input submission

❓ Validate medicine details

❓ Use local storage (no external data transfer)

❓ Error handling using alerts and conditions

4.7 Integration

All modules are seamlessly integrated using event-driven programming. Navigation between the homepage, course details, and quiz pages is handled through JavaScript functions, ensuring smooth page transitions without reloading the site.

4.8 Output Screens (Snapshots)

Include screenshots for:

1. Home Page – Medicine list
2. Add Medicine Page
3. Reminder Alert Screen
4. Status Page

Chapter 5: System Testing

5.1 Introduction

System testing is a crucial phase that ensures the developed application meets all functional and non-functional requirements. It validates whether the system performs as expected under various conditions. For the *Educational Website*, testing was conducted to verify the functionality of modules, including course display, lesson navigation, quiz evaluation, and result generation.

5.2 Objectives of Testing

- ❑ Verify all modules work correctly
- ❑ Identify and fix errors
- ❑ Ensure correct outputs

🔗 Test responsiveness

5.3 Types of Testing Performed

a) Unit Testing

Each JavaScript function and webpage component was tested independently. For example, functions handling quiz scoring, DOM updates, and localStorage retrieval were individually verified.

b) Integration Testing

After unit testing, all modules were combined and tested as a whole to ensure that navigation between pages (Home → Lessons → Quiz → Result) worked without errors.

c) System Testing

The complete web application was tested to ensure all functional requirements were met — including quiz evaluations, course listings, and responsiveness.

d) User Acceptance Testing (UAT)

The system was demonstrated to sample users (students) to gather feedback. The website's layout, speed, and usability were reviewed, and suggestions were implemented where necessary.

e) Cross-Browser and Device Testing

The system was tested on popular browsers such as **Google Chrome**, **Mozilla Firefox**, and **Microsoft Edge**, and on devices like **laptops**, **tablets**, and **mobile phones** to ensure responsiveness.

Test ID	Module	Description	Type	Expected Output	Status	Expected Output
T01	Home	Display medicines	Functional	List visible	Pass	
T02	Add	Add medicine	Functional	Data saved	Pass	
T03	Reminder	Trigger alert	Logic	Alert shown	Pass	
T04	Status	Update status	Output	Correct status	Pass	
T05	Navigation	Move pages	Integration	Smooth flow	Pass	

T06	Validation	Empty input	Validation	Error shown	Pass
T07	Responsive	Mobile view	UI	Adjust layout	Pass
T08	Storage	Save data	Data	Persist after refresh	Pass

verified by comparing expected and actual results.

5.6 Error Handling

- Input validation ensures that blank or invalid quiz responses are not processed.
- Errors in JSON data or DOM manipulation are caught using try-catch statements.
- Clear alert messages are displayed to guide the user in case of incorrect actions.

5.7 Performance and Usability Testing

- **Performance:** Page load time was under 2 seconds in standard browsers.
- **Usability:** Students found the website easy to navigate, visually clear, and responsive.
- **Accessibility:** The system supports keyboard navigation and uses readable font styles for better visibility.

5.8 Results and Observations

All modules functioned as expected. The website performed well on multiple devices, and user feedback confirmed that it was interactive and efficient. No critical defects were identified in the final round of testing.

Chapter 6: Results and Discussion

6.1 Introduction

This chapter presents the practical results obtained after implementation and testing. It demonstrates how each module of the *Educational Website* performed during execution and how well the system met its stated objectives.

6.2 System Outputs

- ❓ Home Page → Medicine list
- ❓ Add Page → Add medicines
- ❓ Alert → Reminder notification
- ❓ Status Page → Taken/Missed

6.3 Performance Analysis

- ❓ **Fast response**
- ❓ **Accurate alerts**
- ❓ **Stable performance**

6.4 User Feedback

- ❓ Easy to use
- ❓ Helpful reminders
- ❓ Clean interface

Chapter 7: Conclusion and Future Enhancement

7.1 Conclusion

The Medicine Reminder App successfully helps users manage medicines and improves health tracking using modern web technologies.

7.2 Limitations

- ❓ No login system
- ❓ No backend database
- ❓ Limited features

7.3 Future Enhancement

- ❓ **Add login system**
- ❓ **Connect database (MongoDB)**
- ❓ **Add caretaker alerts**
- ❓ **Mobile app version**
- ❓ **AI health suggestions**

Chapter 8: References

8.1 Books & Journals

4. *Web Technologies: HTML, CSS, JavaScript, PHP, Java, JSP, XML, and AJAX* — Uttam K. Roy, Oxford University Press.
5. *Learning Web Design* — Jennifer Niederst Robbins, O'Reilly Media.
6. *E-Learning and the Science of Instruction* — Ruth C. Clark & Richard E. Mayer, Wiley.

8.2 Online Resources

7. MDN Web Docs — <https://developer.mozilla.org>

8.3 Tools & Frameworks Used

- **Editor:** Visual Studio Code
- **Languages:** HTML5, CSS3, JavaScript (ES6)
- **Framework:** Bootstrap 5 (for responsive UI)
- **Database (Future Scope):** JSON / MySQL
- **Browser:** Google Chrome / Microsoft Edge

Appendices

Appendix A – Source Code

Include your main source files:

- ❓ **App.js / index.js — Main application structure (React entry point)**
- ❓ **Components (Home.js, AddMedicine.js, Reminder.js, Status.js) — UI components**
- ❓ **App.css / style.css — Styling and responsive layout**
- ❓ **script.js (if used) — Core logic for reminders and interactivity** (*Attach or paste formatted source code snippets here — only essential parts, not full-length code, to maintain report readability.*)

Appendix B – Screenshots of Web Pages

Attach labeled screenshots with captions:

- ❓ **Figure 1.1: Home Page displaying list of medicines**
- ❓ **Figure 1.2: Add Medicine Page interface**
- ❓ **Figure 1.3: Reminder Alert notification screen**
- ❓ **Figure 1.4: Status Page showing taken/missed medicines**
- ❓ **Figure 1.5: Responsive mobile view** (*Ensure all figures are captioned and referenced in your text, e.g., “Refer to Figure 1.3”*).

Appendix C – User Manual / Installation Guide

Steps to Run the Project:

- ❓ Download all project files (React project folder)
- ❓ Open the folder in **Visual Studio Code**
- ❓ Open terminal and run:

npm install
- ❓ Then run:

npm start
- ❓ Open browser (Chrome/Edge) → App will run on localhost
- ❓ Add medicines and set reminders
- ❓ Receive alerts and track status

System Requirements:

- OS: Windows / macOS / Linux
- Browser: Latest Chrome or Firefox
- RAM: Minimum 2 GB
- Storage: 100 MB free
